TITLE: The Petrography of the Clay-Carbonate Chokrak and Karagan Rocks of the Groznyy-Dagestan Region (K petrografii glinisto-karbonatnykh porod chokraka i karagana Groznensko-Dagestanskoy oblasti)

PERIODICAL: Tr. Vses. neft. n.-i. geologorazved. in-ta, 1956, Nr 95, pp 189-197.

ABSTRACT: In the lower Karagan rocks there is found a large number of layers of clay-carbonate rocks, traceable for a considerable distance. Generally two or three carbonate minerals occur in them, one of which is dominant. In northern Dagestan argillaceous or argillaceous-calcareous dolomites predominate, with admixtures of ankerite and mesitite. In the Groznyy region argillaceous mesitites with ankerite or dolomite and argillaceous ankerites are dominant. In the clay-carbonate Chokrak

Geologicheskiy sbornik, 3 (Collection of Articles in Geology, Vol. 3) Leningrad, Gostoptekhizdat, 1958. 471 p. (Series: Its: Trudy, vyp. 126) 2,400 copies printed.

Ed.: Kudryavtsev, Nikolay Aleksandrovich; Executive Ed.: Fedotova, M.I.; Tech. Ed.: Gennad'yeva, I.M.

PURPOSE: The book is intended for petroleum geologists working in Siberia and other petroliferous regions of the USSR and all other specialists operating in the field of oil recovery.

COVERAGE: The present collection of articles covers a large variety of subjects in the field of petroleum geology. Among them are problems in general geology and tectonics, such as studies of the boundaries between Cambrian and Precambrian rocks, methods for differentiating red beds under complex tectonic conditions, the relationship between the Urals and Pay-Khoy and Taymyr, the tectonics of the Carpathian Mountains, including the stratigraphy of different regions of the

Abstract : In connection with two epidemics of coxiella disease (Q-fever) in Czechoslovakia in 1954, sheep, goats and cattle were inspected by the "RSK" [RBC - Reaction of Blood Coagulation?] method in various districts, particularly in localities where previous infections in man were observed. Positive reactions were obtained in some of the animals. The efforts in 1954 to isolate the specific causal agents from cow and sheep milk were a complete failure. However, when guinea pigs were infected with a material from the test animals, characteristic

TITLE : Organic-Mineral Fertilizing Mixtures on Southern Chernozems of Stalingrad Oblast'.

ORIG. PUB. : Izv. Timiryazevsk. s.-kh. akad., 1957, No. 5, 37-42

ABSTRACT : On the chernozems of Stalingrad oblast', application of organic-mineral mixtures is a highly effective method and more within the reach of the kolkhozes of this zone since it requires fewer expenditures. Organic-mineral mixture applied to a fallow field is not less effective than 20 tons of manure applied in combination with the same amount of mineral fertilizers which are a part of the fertilizing mixture. -- V. D. Astaf'yeva

TITLE: Alchevsk Metallurgists are Fulfilling their Obligations (Alchevskiye metallurgi vypolnyayut obyazatel'stva)

PERIODICAL: Metallurg, 1958, Nr 7, pp 8 - 9 (USSR)

ABSTRACT: The author, who is the director of the Alchevskiy metallurgicheskiy zavod (Alchevsk Iron and Steel Works) imeni Voroshilov, describes their growth into one of the largest in the USSR. Re-building of the war-destroyed plant started in 1943 and two open-hearth furnaces were commissioned in the new melting shop early in 1952. The 2,250 medium sheet mill was started in the same year, further plant additions following in 1952-55. In 1956, the first 500-ton open-hearth furnace in Europe started operating at the Works and a large blast furnace (Nr 4) was blown in in 1957. At present, four blast furnaces operate with high top-pressure, humidified blast, while Nr 5, smelting ferro-manganese, is operated with intensive cooling of the top. The open-hearth furnaces have been highly automated, are operated with evaporative cooling with injection of compressed air into the gas port and removable slag pockets. New types of steels rolled include MKhGS, 19G, SKhL-1, SK, MK, 09G2. The author states the between 1952 and 1957, total production increased by 56.6% (pig iron by 86.6, steel by 130.9

Card1/2

Alchevsk Metallurgists are Fulfilling Their Obligations

and rolled products by 173.9%). It is planned in the next seven years to increase pig iron, steel and rolled-product outputs by factors of 2.5, 2.4 and 2.4, respectively, with the introduction of two large blast furnaces, a second melting shop, a second reducing mill, a continuous 1,700 thin strip mill, a cold-rolling mill, a tube mill and two sinter plants. The author names the following distinguished operators at the plant: Chekalkin, Voytenko, Grabko, Deyneg, Gorlinskiy, Sushko, Fedyuchenko, Luganskiy. He outlines housing developments connected with the Works. He mentions the plans at the Works for production in excess of the target and that in the first quarter of this year pig iron, steel and rolled products increased by 16.3, 18.4 and 11.4%, respectively. There are 2 figures.

GMYRYA, V.M.

135-7-13/16

SUBJECT: USSR/Welding.

AUTHOR: Gmyrya, V.M.

TITLE: Changing the Design of Running Wheels and Guide Bars of Self-Moving Welding Heads (Izmeneniye konstruktsii khodovykh begunkov i rel'sovykh putey samokhodnykh svarochnykh golovok).

PERIODICAL: "Svarochnoye Proizvodstvo", 1957, # 7, p 28 (USSR).

AESTRACT: The author's idea consists of replacing the V-shaped profile of the circular groove in the rim of the runner by a U-shaped one - by welding a round bar, fitting the U-groove to the former profiled guide bar.
The guide bars in the old design showed non-uniform wear, which caused a wavy motion of welding heads and the guide bars had to be machined to fit the V-grooves.
The new design has the following advantages: machining the guide bar is eliminated, the wear is reduced and uniform, replacing guide bars is simplified, the welding head runs easily at any tilting angle of the electrode.

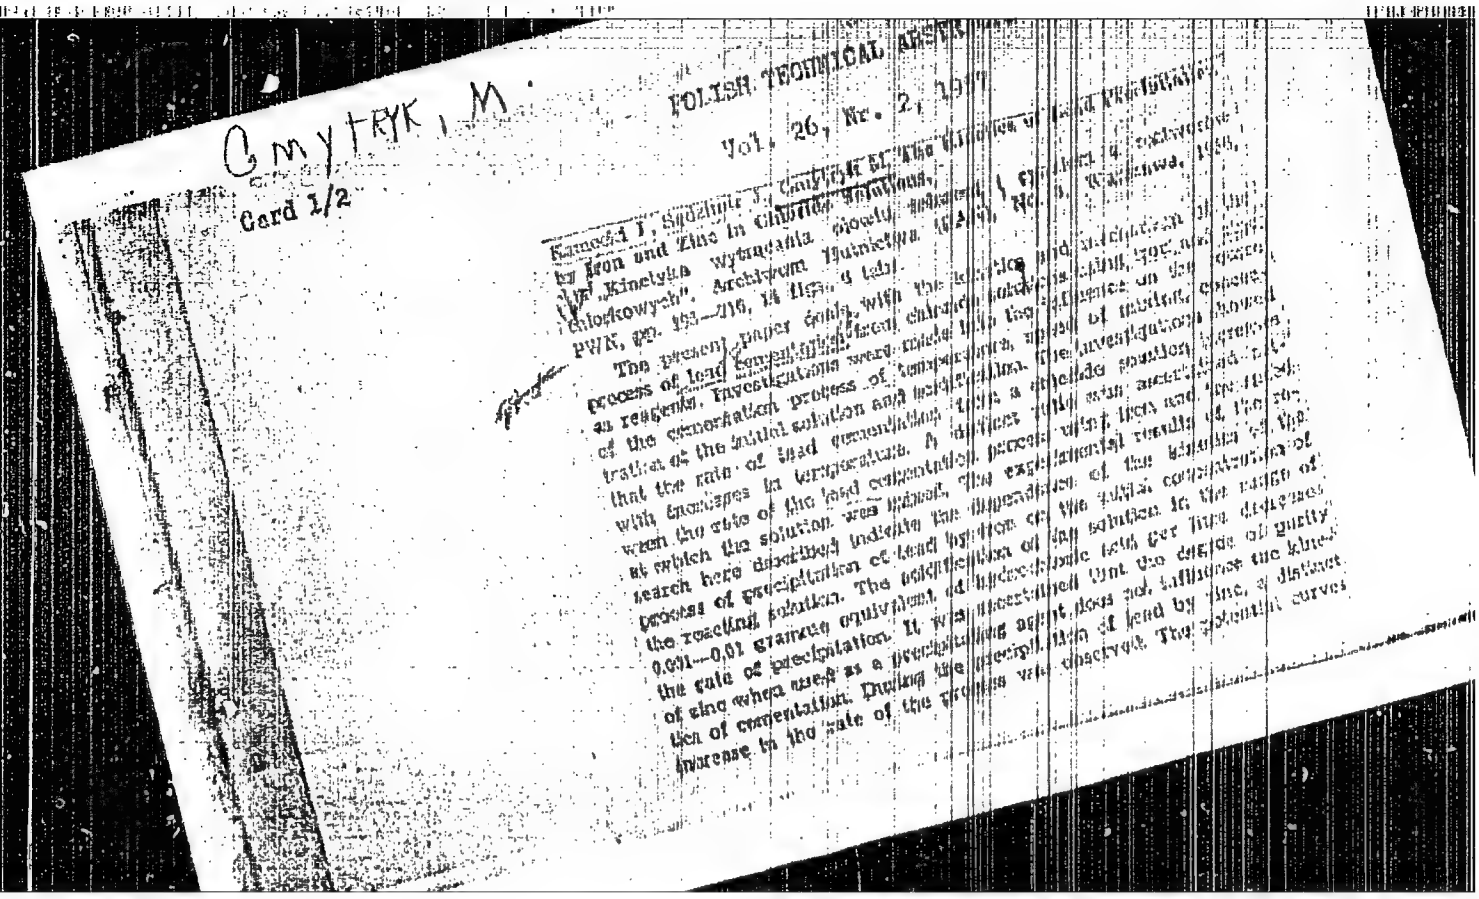
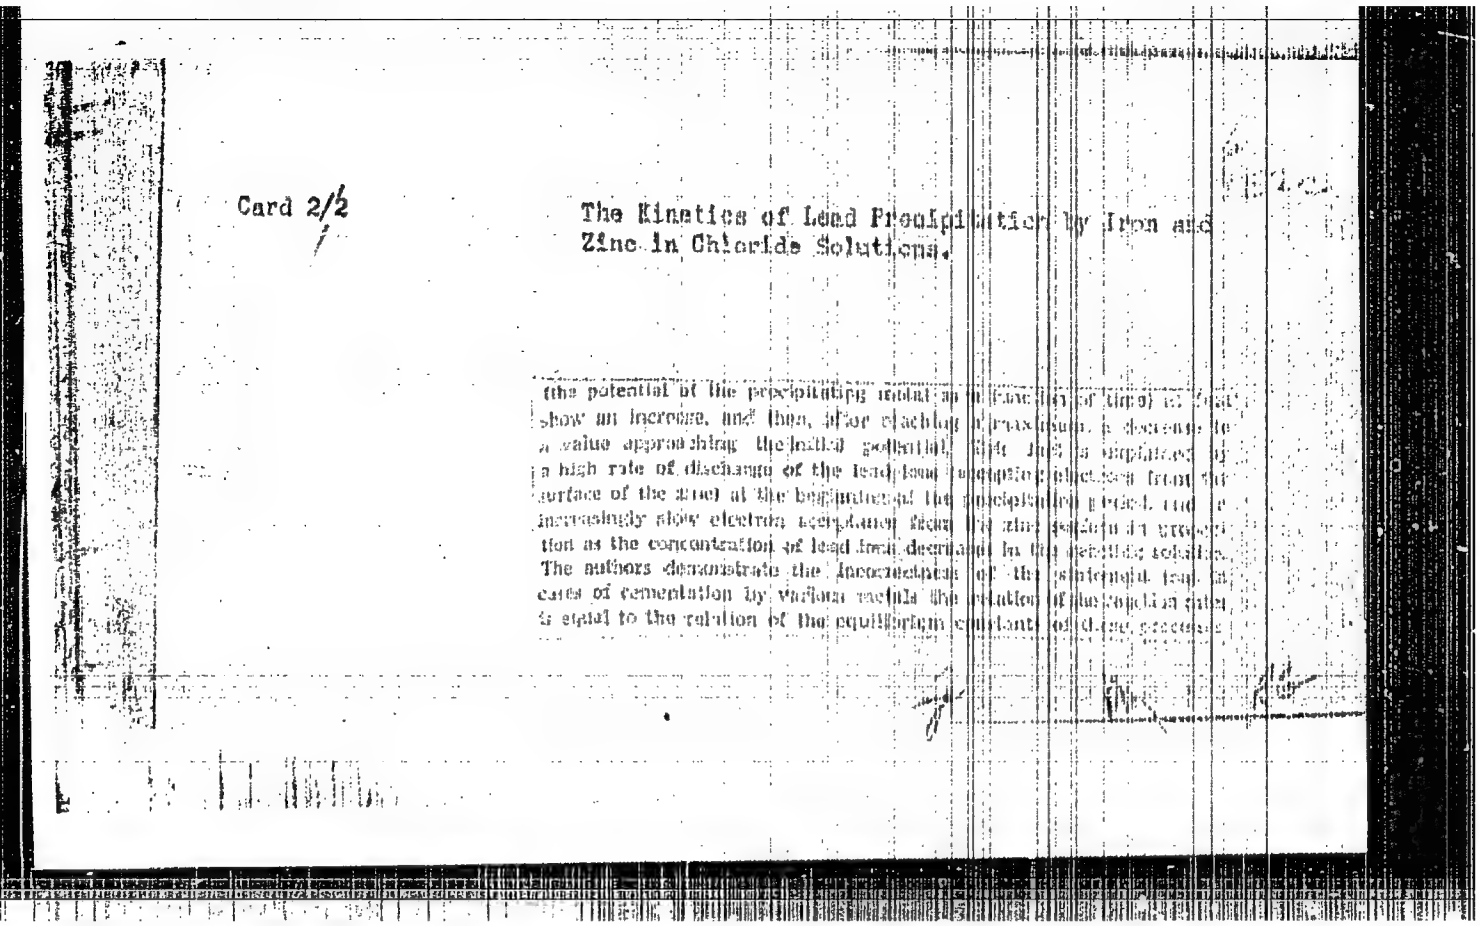
GMYTRYK, MICHALINA

The kinetics of lead precipitation by iron and zinc in chloride solutions. Julian Kamecki, Lucy Sedzimir, and Michalina Gmytryk. *Polska Akad. Nauk, Archiwum*, 1, [illegible] (English summary).—The kinetics and mechanism of the process of Pb pptn. from $PbCl_2$ solns. by aid of Fe and Zn is investigated. The results are presented for the effects of temp., speed of mixing, concn. of the starting solns., and amt. of added free HCl in the course of the pptn. The rate of pptn. increases with increasing temp., and if Fe is used, there is a distinct relation between the rate of pptn. and the rate of stirring; furthermore, the initial concn. of the soln. affects the kinetics too. If 0.001 to 0.01 mole of HCl is added to a l. of soln., the pptn. rate decreases. In the expts. with Zn the purity of the Zn had no effect on the rate of pptn. *per se*, yet with this metal the rate increased as the reaction progressed. In plots of the potential of the pptg. metal as a function of time, the curves go through a max., and then drop asymptotically to the original value. This is probably because the Pb^{++} first discharges at a great rate, i.e. it accepts electrons from the surface of the Zn, and the electron acceptance from the Zn becomes slower and slower as the concn. of the Pb^{++} decreases in the reacting soln. The common belief that in the pptn. by various metals the ratio of the reaction rates is equal to the ratio of the equil. consts. is erroneous. Werner Fischbeck





Card 2/2

The Kinetics of Lead Precipitation by Iron and Zinc in Chloride Solutions.

the potential of the precipitating metal a[illegible] time of time it first show an increase, and then, after reaching a maximum, a decrease to a value approaching the initial potential. This is explained by a high rate of discharge of the lead ions [illegible] from the surface of the zinc at the beginning of the precipitation period, and an increasingly slow electron acceptance from the cathodic areas as the concentration of lead ions decreases in the electrolyte solution. The authors demonstrate the inconsistencies of the principal theories of cementation by various methods the relation of the rate of precipitation is equal to the solution of the equilibrium constant of the process

velocity. Experimental methods and equipment are described with 8 drawings. The test results are evaluated in 6 tables for magnitude of relative error due to thermodynamic and hudrodynamic conditions. 13 charts and 3 tables with test data.

The test equipment, method and final results appear to be interesting for workers in heat transmission.

Purpose: The book is intended for workers in scientific research institutions and for design engineers in the field of heat installations.

Facilities: Central Scientific Institute for Boiler and Turbines (TsKTI).

TITLE: Insulating compressed oxygen respirator. Class 61, No. 172196

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 12, 1965, 123

TOPIC TAGS: respirator, compressed gas, oxygen, breathing apparatus, cooling, manometer

ABSTRACT: This Author Certificate presents an insulating compressed oxygen respirator consisting of a mouthpiece with a breathing valve, breathing hoses, a regenerating cartridge, an oxygen tank with a valve, a manometer, an oxygen feeding assembly, a breathing bag, and a cooling unit with a refrigerating compound (see Fig. 1 on the Enclosure). To decrease the size of the respirator and to intensify the chilling of the inhaled air, the cooling unit with the refrigerating compound, placed in the breathing bag, is made in the form of a cartridge with a duct which passes through it and which is connected to the inhaling hose. To diminish the weight by removing the cooling unit from the bag when chilling of the inhaled air is unnecessary, the bag is provided with a throat with a valve. Orig. art. has: 1 diagram.

INST. :
TITLE : The Role of Deep Vertical Roots of Fruit Trees in Utilization of Subsoil Moisture.

ORIG. PUB. : Agrobiologiya, 1957, No 2, 115-127

ABSTRACT : In 1952-1954, in Rostovskaya Oblast', at the Persianovskaya experimental land reclamation station, experiments were initiated for determining the existence of deep roots of trees of various fruit bearing varieties, and ascertaining the capability of these roots to extract the soil moisture content from different strata of the soil. Notwithstanding quantitative differences, the general nature of the distribution of roots within individual soil strata, was essentially the same for all the varieties under study. The main body of roots (by weight), mostly of horizontal roots, was found within the upper 80 cm stratum, and showed a well defined maximum at a depth of 20-40 cm. The greatest amount of vertical roots, as a rule,

TOPIC TAGS: carge ship, harbor engineering, merchant marine status, marine engineering

PURPOSE AND COVERAGE: This booklet is intended for engineers, technicians, economists, shippers, and deck officers in the merchant marine. It may also be used by personnel in scientific-research and planning organizations of the Ministry of the Navy and other agencies, as well as by students in higher and middle educational institutions studying economics and operations organization of the merchant marine and seaports. In the booklet, the author proposes a new method for the comprehensive determination of the optimum sizes of vessels and corresponding port facilities (approach channels, berthings, dock facilities). An analysis is given of the technical and economic factors governing the advantages accruing from the simultaneous increase in vessels' sizes and depths inports and approach channels. The results of an analysis of Soviet and non-Soviet merchant fleets are presented along with information on the
